

Design Studio 3

Peers: Matt Sheets and Melanie Justiniano

The group gave us very helpful feedback on the direction of our project, and even helped us improve some of our features already. Among those contributions, the group gave us suggestions on our use of color for the visualization, suggesting the use of color opacity to reflect different data values instead of the color scale we were originally using, ranging from green to red.

Furthermore, the team gave us ideas on how to make our visualization more intuitive, and walked us through some points of the visualization that were not as clear to them as they were to us. We are excited about the feedback we got, and we hope to incorporate some of their suggestions into the final version of our project. As an example, we intend to plot best fitting curves for the data that users chose to compare so that they can see possible correlations between different data factors in the graph.
